About me

Dragos Madarasan – <https://dragos.madarasan.com>

- Solutions Architect @ AWS, covering Romania and Hungary
- Work with and support clients, partners, NGOs, Public Sector
- Based in Munich, Germany, often in Romania
- Previously Support Engineer and ProServe Consultant @ AWS

Agenda

- Introduction
- Availability
- Storage
- Security
- Backup and monitoring
- Data migration

AWS by Category: Core Services

Compute

Amazon EC2

AWS Elastic Beanstalk

Auto Scaling

AWS Lambda

Amazon Elastic Container Registry

Amazon Elastic Container Service

Amazon Lightsail

AWS Batch

Networking

Amazon VPC

Amazon Route 53

AWS Direct Connect

Elastic Load Balancing

Storage

Amazon S3

Amazon EBS

Amazon CloudFront

Amazon Glacier

Amazon Elastic File System

AWS Snowball

Storage Gateway

AWS Snowmobile

Database

Amazon RDS

Amazon DynamoDB

Amazon Redshift

AWS Database Migration Service

Amazon ElastiCache

Choose the best service for your needs

Amazon RDS SQL Server

- Managed physical infrastructure
- Managed DB Install and backups
- Managed OS and patching
- Managed high availability and scaling

SQL Server on Amazon EC2

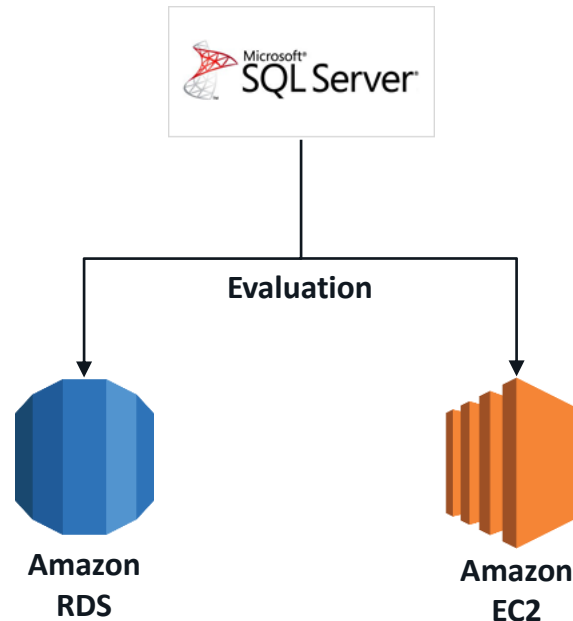

- Managed physical infrastructure
- Managed OS installation
- Managed scaling
- OS-level control

Choose the best service for your needs

Amazon RDS SQL Server

Your responsibility:

- App optimization and tuning
- Deployment Orchestration

SQL Server on Amazon EC2

Your responsibility:

- App optimization and tuning
- Deployment orchestration
- Monitoring and recovery
- High availability
- Backups
- DB & OS patching

SQL Server features at a glance

Amazon RDS

Amazon EC2

Versions supported:

2012, 2014, 2016, 2017

All

Editions supported:

Express, Web, Standard, Enterprise**

All

High availability:

AWS-managed

Self-managed; AlwaysOn, Mirror, Log Ship

Encryption:

Encrypted Storage using AWS KMS (all editions); TDE Support

Authentication:

Windows & SQL authentication

Backups:

Managed automated backups

Maintenance plans & 3rd party tools

Maintenance:

Automatic software patching

Self-managed

SQL Server EC2 vs. RDS

	EC2	RDS
License included	✓	✓
BYOL	✓	
Full control over the instance	✓	
Automated backups		✓
Self-managed AlwaysOn availability groups	✓	
AWS-managed Multi-AZ deployment		✓

Amazon Relational Database Service (Amazon RDS)

Amazon
Aurora

MySQL

PostgreSQL

MariaDB

Microsoft SQL Server

ORACLE

Easy to administer

Easily deploy and maintain hardware, OS and DB software; built-in monitoring

Performant & scalable

Scale compute and storage with a few clicks; minimal downtime for your application

Available & durable

Automatic Multi-AZ data replication; automated backup, snapshots, and failover

Secure & compliant

Data encryption at rest and in transit; industry compliance and assurance programs

Amazon RDS - Managed Service

What does Amazon RDS Manage?

- Provisioning
- Installation and Patching
- Automated Backups
- Restores: Snapshot and point-in-time
- High Availability
- Monitoring

Amazon RDS - Configuration

What can you configure?

- Instance type/Class
- Engine version/Edition
- Storage
- Network Connectivity
- Time Zone
- Backup Retention
- Encryption
- High Availability
- Monitoring

SQL Server as a managed service

AMAZON RDS

- Same SQL Server DB engine as with Amazon Elastic Compute Cloud (Amazon EC2)
- Management, monitoring, and automation layer around the DB engine
- Automated full DB instance backups, with point-in-time restore
- Automated high availability (HA)
- Automated provisioning, patching, monitoring, directory integration

LIMITATIONS

- Cannot run SSRS, SSIS, SSAS on the DB instance (works as data source)
- Maximum 30-100 databases per instance
- No sysadmin role, server administrator, or direct file system access
- <https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/UsingWithRDS.MasterAccounts.html>
- Not supported: MSDTC, maintenance plans, database mail

Amazon RDS for SQL Server

Continuously improved

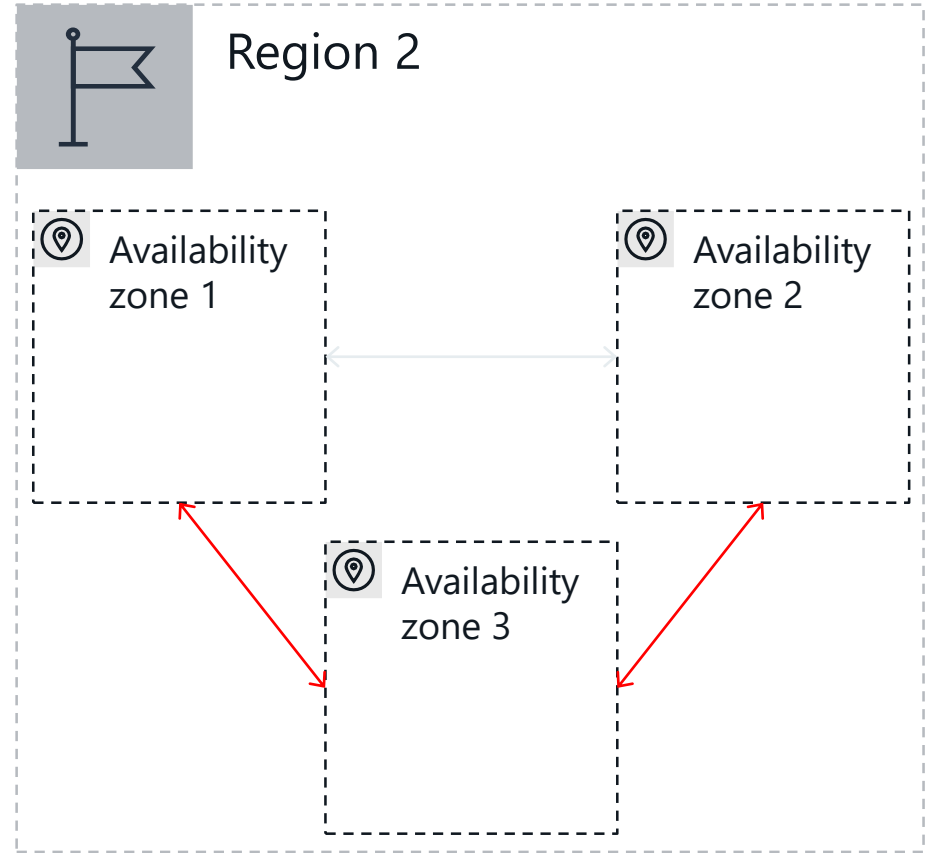

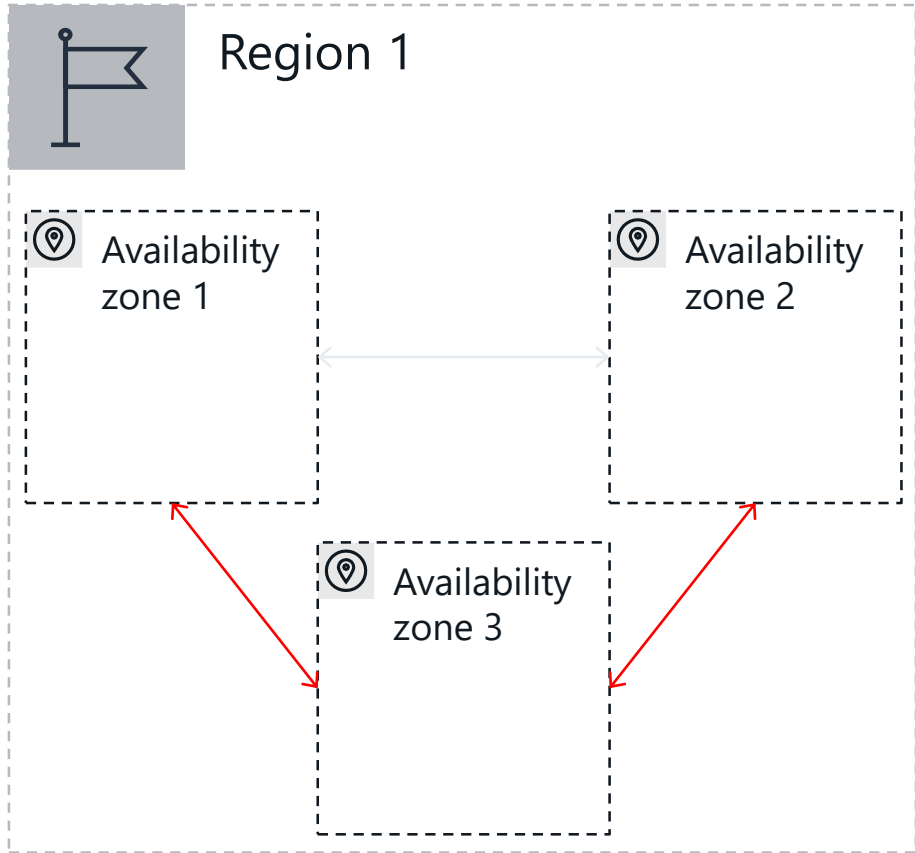

- Change server-level collation – August 6, 2019
- Multi-File native restores – June 5, 2019
- SQL Server Auditing – May 24, 2019
- Always On Availability Groups for SQL Server 2017 – May 23, 2019
- Increased database limit per database instance – May 22, 2019
- Performance insights – March 4, 2019

Agenda

- Introduction ✓
- (High) Availability
- Storage
- Security
- Backup and monitoring
- Data migration

Availability - concepts

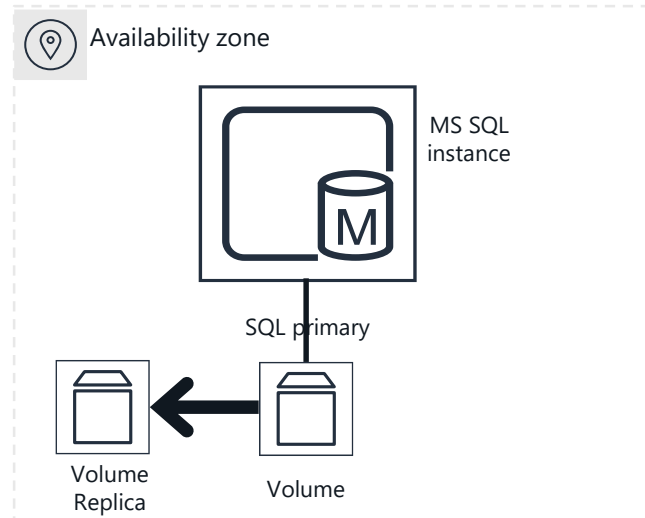

Regions and Availability Zones (AZs)

Availability - concepts

Single-AZ

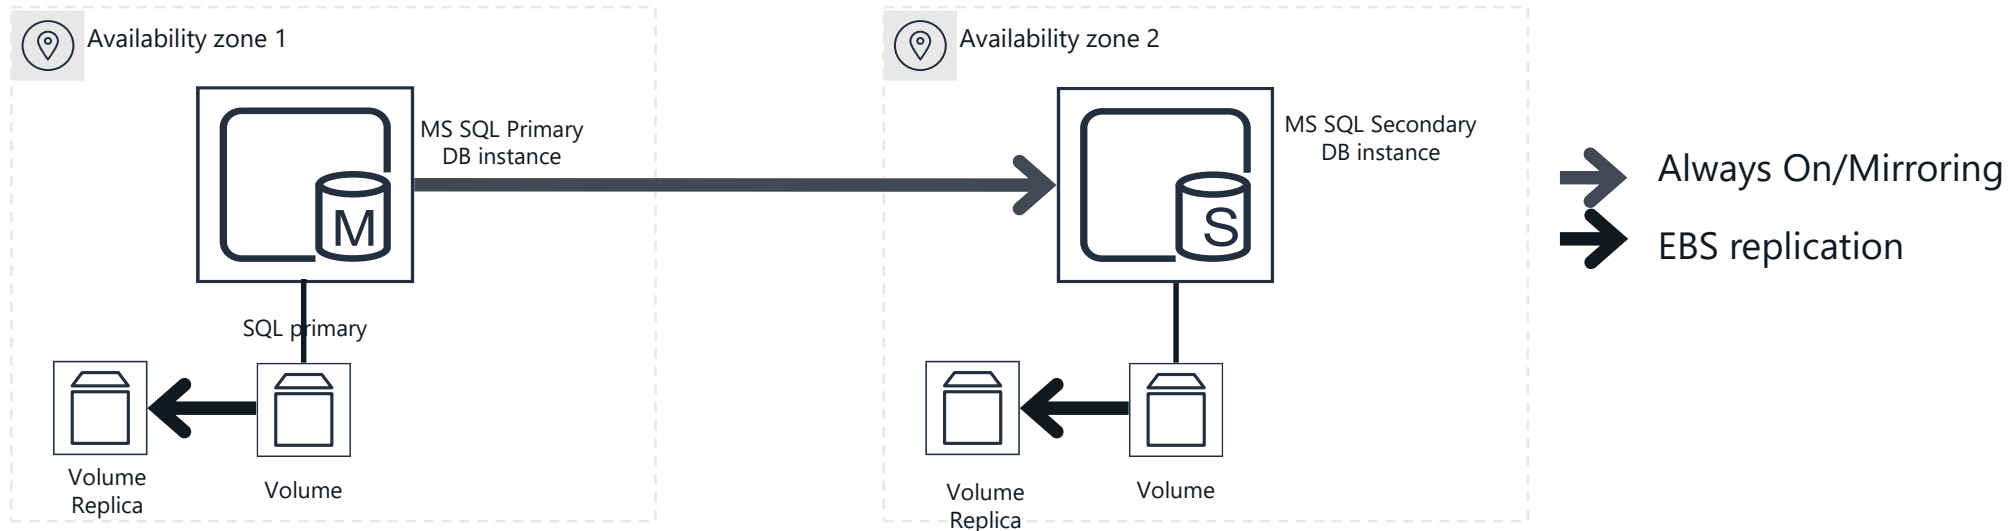

- Synchronous volume replication within AZ
- Recovery time varies from mins to several hours for AZ outages

Availability - concepts

Multi-AZ

- Synchronous volume replication within AZ and synchronous data replication across AZs
- Recovery time typically ~ 1 minute
- Uses Always On for 2016/2017 Enterprise Edition and DB Mirroring for other versions/editions
- Failover triggered by SQL Server

Availability - mirroring

AMAZON RDS FOR SQL SERVER MULTI-AZ DEPLOYMENT

- Fully managed and automated HA solution in an AWS region
- Principal and secondary DB nodes in different AZs
- Witness in a third AZ
- Leverages SQL Server DB mirroring
- Works with standard and enterprise editions
- DNS endpoint provided for app connectivity

CONSIDERATIONS

- Mirroring impact on change-heavy workloads

Availability - AlwaysOn

AMAZON RDS FOR SQL SERVER MULTI-AZ DEPLOYMENT

- SQL Server 2016 and 2017 Only
- Fully managed and automated HA solution in an AWS region
- Principal and secondary DB nodes in different AZs
- Leverages AlwaysOn (non-domain joined)
- Enterprise edition only
- Secondary node is completely passive
- DNS endpoint provided for app connectivity
 - AlwaysOn AG listener

Agenda

- Introduction ✓
- Availability ✓
- Storage
- Security
- Backup and monitoring
- Data migration

Storage

AMAZON RDS STORAGE

- Low latency, persistent, network-attached block storage
- Easy to change after initial selection
- Maximum storage: **16 TB**
- Maximum IOPS: **32,000**
- Maximum throughput: **500 MiB/sec**
- Amazon RDS **storage throughput** depends on DB instance class (see equivalent Amazon EC2 EBS optimized instance type)
- Keep in mind this includes TempDB

MONITORING I/O EFFICIENCY

- Amazon CloudWatch metric **average queue depth**
 - I/O requests waiting to be serviced

Agenda

- Introduction ✓
- Availability ✓
- Storage ✓
- Security
- Backup and monitoring
- Data migration

Security– tenets

- 1** Restrict Access
Security Groups. Network ACLs. Subnets.
- 2** Audit Access
SQL Server Audit. SQL Server trace.
- 3** Encrypt Data
TDE. KMS. SSL.

Security

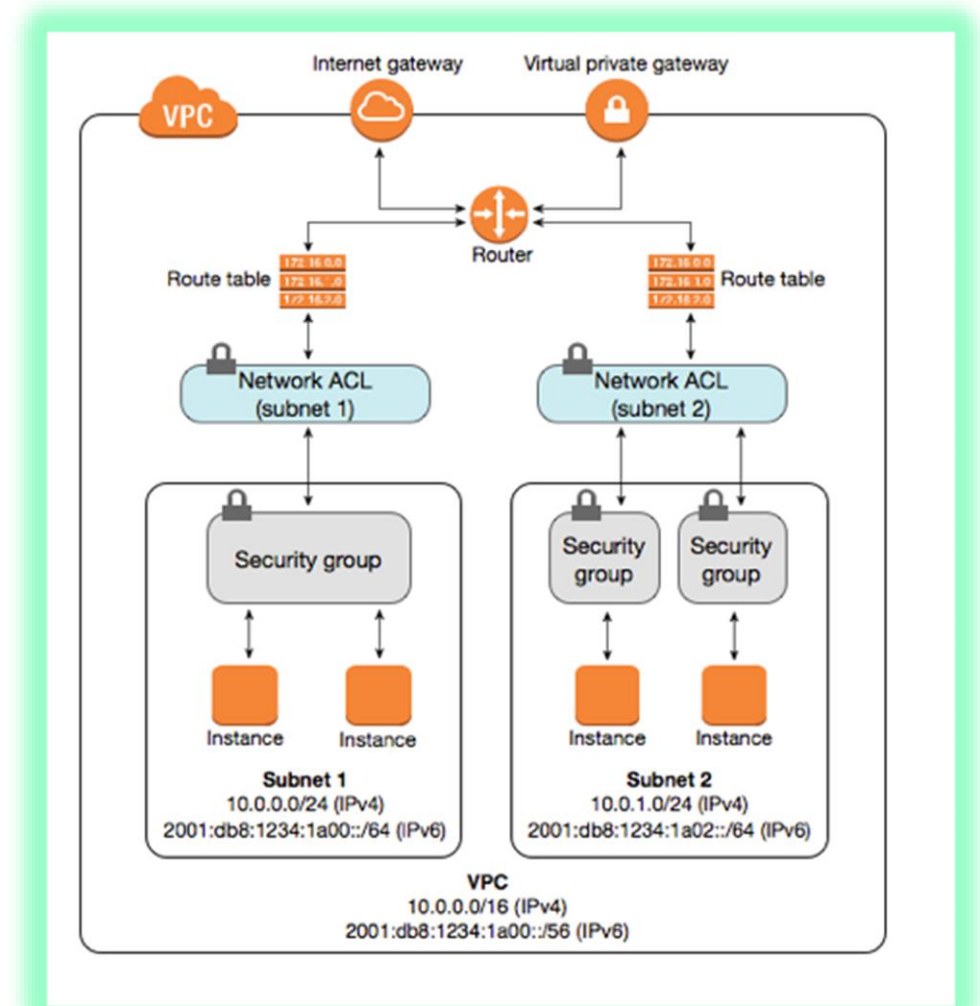

Restrict Access :

Use AWS Identity and Access Management (IAM) accounts to control access to Amazon RDS API actions

Restrict database accessibility

Avoid enabling public access

Avoid using port 1433

Security – auditing

Audit Access:

Enable rds.sqlserver_audit in the parameter group

Audit Action Groups enabled

```
SERVER_PERMISSION_CHANGE_GROUP  
SERVER_PRINCIPAL_CHANGE_GROUP  
SERVER_PRINCIPAL_IMPERSONATION_GROUP  
SERVER_ROLE_MEMBER_CHANGE_GROUP  
BACKUP_RESTORE_GROUP  
DBCC_GROUP  
SERVER_OPERATION_GROUP  
SERVER_STATE_CHANGE_GROUP  
SERVER_OBJECT_CHANGE_GROUP  
SUCCESSFUL_LOGIN_GROUP  
FAILED_LOGIN_GROUP  
LOGOUT_GROUP  
AUDIT_CHANGE_GROUP
```

```
DATABASE_PERMISSION_CHANGE_GROUP  
DATABASE_PRINCIPAL_CHANGE_GROUP  
DATABASE_OWNERSHIP_CHANGE_GROUP  
DATABASE_PRINCIPAL_IMPERSONATION_GROUP  
DATABASE_ROLE_MEMBER_CHANGE_GROUP  
DATABASE_OBJECT_ACCESS_GROUP  
DATABASE_OBJECT_CHANGE_GROUP  
SUCCESSFUL_DATABASE_AUTHENTICATION_GROUP  
FAILED_DATABASE_AUTHENTICATION_GROUP
```

Security – auditing contd.

Audit Access :

Enable SQL Server Auditing

- Compression by default : up to 80% compression
- Retain audit files on the server for quick access

Edition	Version	2012/2014	2016/2017
Enterprise		Server and DB level	Server and DB level
Standard/Web/Express		Server level	Server and DB level

SQL Server 2008 R2 trace example

```
-- Create a trace file max size of 50MB called LogionTraceTest:
DECLARE @file_name NVARCHAR(245) = 'D:\RDSDBDATA\Log\LogionTraceTest';
DECLARE @max_file_size BIGINT = 50;
DECLARE @on BIT = 1;
DECLARE @rc INT;
DECLARE @traceid INT;
EXEC @rc = sp_trace_create @traceid OUTPUT, 2, @file_name, @max_file_size

-- Set Audit events as needed. 14 --> Successful login ; 20 --> Failed login:
IF (@rc = 0) BEGIN
    EXEC sp_trace_setevent @traceid, 14, 6, @on --NTUserName
    EXEC sp_trace_setevent @traceid, 14, 7, @on --NTDomainName
    EXEC sp_trace_setevent @traceid, 14, 8, @on --Hostname
    EXEC sp_trace_setevent @traceid, 14, 9, @on --ClientProcessID
    EXEC sp_trace_setevent @traceid, 14, 10, @on --ApplicationName
    EXEC sp_trace_setevent @traceid, 14, 11, @on --LoginName
    EXEC sp_trace_setevent @traceid, 14, 12, @on --SPID
    EXEC sp_trace_setevent @traceid, 14, 14, @on --StartTime
    EXEC sp_trace_setevent @traceid, 14, 15, @on --EndTime
    EXEC sp_trace_setevent @traceid, 14, 23, @on --Success
    EXEC sp_trace_setstatus @traceid, 1
END
```

SQL Server 2008 R2 trace example contd.

-- Reading the created trace file

```
select  
StartTime,EndTime,Success,ClientProcessID,LoginName,SPID,Hostname,ApplicationName,NTUse  
rName,NTDomainName FROM fn_trace_gettable('D:\rdsdbdata\Log>LoginTraceTest.trc',  
default)where LoginName != 'NT AUTHORITY\SYSTEM';
```

-- Recording the trace file data to a table.

```
create database auditdb
```

```
select * into auditdb.dbo.logindata from  
fn_trace_gettable('D:\rdsdbdata\Log>LoginTraceTest.trc', default) where LoginName !=  
'NT AUTHORITY\SYSTEM';
```

```
insert into auditdb.dbo.logindata select * FROM  
fn_trace_gettable('D:\rdsdbdata\Log>LoginTraceTest.trc', default) where LoginName !=  
'NT AUTHORITY\SYSTEM';
```

Security

Encrypt Data: At rest

Enable storage encryption – AWS Key Management Service (AWS KMS)

- Transparent to application
- No additional cost
- Minimal performance impact
- Log backups are also encrypted
- Supported across all editions

Transparent Data Encryption for Enterprise Edition

Security – encryption contd.

Encrypt Data: in-transit

Set `rds.force_ssl` : Forces all client connections to be encrypted

```

Agenda

- Introduction ✓
- Availability ✓
- Storage ✓
- Security ✓
- Backup and monitoring
- Data migration

Backup - concepts

- Automatic snapshots taken daily
 - Transaction log backups every five minutes are streamed directly to Amazon S3
 - Snapshots and logs retained for the configured interval
 - Restore of a snapshot *always* creates a new instance
 - You can take manual snapshots (they are retained forever)
 - Reminder: This is a snapshot of *all* databases
- Native backup/restore
 - Native backups are always *copy only* to not break transaction log chain
 - Native restore will always be to the point of the backup, not point in time
- Practice restoring!
 - Understand the performance profile in particular after a restore
 - How long will it take? How long before the Amazon Elastic Block Store (Amazon EBS) volumes fully restored from S3?

Monitoring

- SQL Server agent
 - Job scheduling (rebuild index, DBCC checks etc.)
 - Some alerting
 - No DB mail
- CloudWatch
 - Enhanced monitoring available
 - Job scheduler available
 - Strategic direction of RDS is to integrate for monitoring
- Performance insights
 - Common RDS management interface
 - Monitors slow queries, etc.
- Third parties: AppDynamics, SQL Sentry, etc.

Performance insights

Database load

Average active sessions (AAS)

Waits SQL Hosts Users

Search SQL queries

Load By Waits (AAS)	SQL
▶  0.43	select count(*) from authors where id < (select max(id) - 30 from authors) and id > (select max(id) - 2500 from authors) union select count(*) from authors where id...
▶  0.41	delete from authors where id < (select max(id) - 30 from authors) and id > (select max(id) - 500 from authors)
▶  0.3	update authors set email = 'toto' where id > (select max(id) - 1 from authors)
▶  0.18	INSERT authors (id,name,email) VALUES (next value for serial,'Priya','p@gmail.com') , (next value for serial,'Priya','p@gmail.com'), (next value for serial,'Priya','p@g...

Agenda

- Introduction ✓
- Availability ✓
- Storage ✓
- Security ✓
- Backup and monitoring ✓
- Data migration

RDS SQL Server data movement

- 1** .BAK file import and export
Leverages SQL Server's native backup functionality
- 2** Database publishing wizard, import/export, bulk copy
Use **bcp**; export to T-SQL files & load using **sqlcmd**
- 3** AWS Database Migration Service (AWS DMS)
Supports heterogeneous migrations in and out (CDC)
- 4** AWS Marketplace
Third-party data import and export tools and solutions

AWS Popup Loft Bucharest

Date: November 11-15, 2019

Time: 9:00 – 5:30

Location: Impact Hub Timpuri Noi, Bucharest

Thank you! Multumesc!
